Education

Pune Institute of Computer Technology, Pune

T.E. in Electronics and Telecommunication Engineering CGPA: 8.49/10

2023 – Ongoing

Experience

Full Stack Intern

Aionyx Solutions | Hybrid

Sep 2025 – Present

- Contributing to the design and development of a CRM platform for Mutual Fund Distributors, working closely with the founder to implement core business features.
- Designed and developed secure RESTful APIs using Express.js, implementing full CRUD operations, input validation, and role-based access control (RBAC) for controlled data access.
- Architect a dynamic Role-Based Access Control (RBAC) system with PostgreSQL relational schema (Roles, Permissions, Role-Permission mappings), JWT authentication middleware, and granular route protection enabling admins to define access policies which are different from that of employees

Projects

SEBI Summarizing Pipeline

AWS Lambda, Puppeteer, Node.js, pdf-parse, OpenAI, S3 | GitHub

- Built a serverless scraping pipeline on AWS Lambda using Puppeteer to automatically extract regulatory circulars from the SEBI archive, with date-range filtering and pagination handling.
- Implemented duplicate detection against AWS S3 before download and processing, avoiding redundant PDF fetches and re-processing of already-stored circulars.
- Extracted text from downloaded PDFs and parsed metadata (circular number, title, date) using pdf-parse and regex, then generated AI summaries via OpenAI's API for regulatory compliance insights.
- Uploaded processed PDFs to S3 and synced metadata plus AI summaries to a backend via authenticated webhook (API key), with automatic local cleanup to manage Lambda's storage limits.

Online Judge Platform

Node.js, Express, Flask, Celery, Redis, Docker, PostgreSQL, Socket.IO | GitHub

- Built a microservices-based code execution engine with async request handling: Node.js/Express receives submissions, Base64 encodes code, and pushes tasks to a Flask API backed by Redis message queue.
- Implemented distributed Celery workers that consume queued tasks from Redis, decode submissions, and create isolated execution directories with language-specific compilation or interpretation logic.
- Optimized performance by caching all test case inputs and expected outputs directly in Redis (bypassing heavy database queries), enabling rapid retrieval during execution and verification phases.

Credenz Clash IEEE

React, Tailwind, Node.js, PostgreSQL | GitHub

- Engineered a dynamic MCQ quiz platform for "Clash", a fast-paced quiz event with real-time functionality, serving 50+ concurrent users during live events.
- Deployed on Azure VM with modular backend architecture and responsive frontend design.
- Integrated 50-50 and double-dip lifelines to enhance user engagement and gameplay experience.

Skills

- Frontend:** React, Next.js, Material-UI
- Backend:** Node.js, Express.js, Flask, Knex.js
- Databases:** PostgreSQL, MongoDB, Redis
- Cloud & Tools:** Docker, AWS, GitHub, Postman

Leadership and Extracurricular

- 1st Place at IEEE Tech Rush Hackathon
- 3rd Place at WebPlot Hackathon – Cummins College
- Conducted SIG sessions in C/C++ for 100+ junior students and mentored peers in programming concepts.
- Tech Head for Techfiesta '25 – led web development for the official event website reaching 500+ attendees.
